

128M-BIT 3V SPI-NOR FLASH MEMORY

Descriptions

The H7A5DM26BACT (128M-bit) Serial Flash provides a storage solution for systems with limited space, pins and power. The product offers flexibility and performance well beyond ordinary Serial Flash devices. They are ideal for code shadowing to RAM, executing code directly from Dual/Quad SPI (XIP) and storing voice, text and data. The device operates on a single 2.7V to 3.6V power supply with current consumption as low as 4mA active and 1µA for power-down. All devices are offered in space-saving packages.

The H7A5DM26BACT array is organized into 65,536 programmable pages of 256-bytes each. Up to 256 bytes can be programmed at a time. Pages can be erased in groups of 16 (4KB sector erase), groups of 128 (32KB block erase), groups of 256 (64KB block erase) or the entire chip (chip erase). The H7A5DM26BACT has 4,096 erasable sectors and 256 erasable blocks respectively. The small 4KB sectors allow for greater flexibility in applications that require data and parameter storage.

The H7A5DM26BACT support the standard Serial Peripheral Interface (SPI), Dual/Quad I/O SPI as well as 2-clocks instruction cycle Quad Peripheral Interface (QPI): Serial Clock, Chip Select, Serial I/O2 (/WP), and I/O3 (/HOLD). SPI clock frequencies of up to 1 Data I/O0 (DI), I/O1 (DO), 04MHz are supported allowing equivalent clock rates of 208MHz (104MHz x 2) for Dual I/O and 416MHz (104MHz x 4) for Quad I/O when using the Fast Read Dual/Quad I/O and QPI instructions. These transfer rates can outperform standard Asynchronous 8 and 16-bit Parallel Flash memories. The Continuous Read Mode allows for efficient memory access with as few as 8-clocks of instruction-overhead to read a 24-bit address, allowing true XIP (execute in place) operation.

A Hold pin, Write Protect pin and programmable write protection, with top or bottom array control, provide further control flexibility. Additionally, device supports JEDEC standard manufacturer and device ID, a 64-bit Unique Serial Number and three 256-bytes Security Registers.

Features

- **Basic Features**
 - Density : 128M-bit / 16M-byte
 - Standard SPI: CLK, /CS, DI, DO, /WP,/Hold
 - Dual SPI: CLK, /CS, IO0, IO1, /WP, /Hold
 - Quad SPI: CLK, /CS, IO0, IO1, IO2, IO3
 - QPI: CLK, /CS, IO0, IO1, IO2, IO3
 - Software & Hardware Reset
- **Highest Performance Serial NOR Flash**
 - 104MHz Single, Dual/Quad SPI clocks
 - 208/416MHz equivalent Dual/Quad SPI
 - 50MB/S continuous data transfer rate
 - More than 100,000 erase/program cycles
 - More than 20-year data retention
- **Efficient “Continuous Read” and QPI Mode**
 - Continuous Read with 8/16/32/64-Byte Wrap
 - As few as 8 clocks to address memory
 - Quad Peripheral Interface (QPI) reduces instruction overhead
 - Allows true XIP (execute in place) operation
 - Outperforms X16 Parallel Flash
- **Low Power, Wide Temperature Range**
 - Single 2.7 to 3.6V supply
 - 4mA active current, <1µA Power-down (typ.)
- **Flexible Architecture with 4KB sectors**
 - Uniform Sector/Block Erase (4K/32K/64K-Byte)
 - Program 1 to 256 byte per programmable page
 - Erase/Program Suspend & Resume
- **Advanced Security Features**
 - Software and Hardware Write-Protect
 - Power Supply Lock-Down and OTP protection
 - Top/Bottom, Complement array protection
 - Individual Block/Sector array protection
 - 64-Bit Unique ID for each device
 - Discoverable Parameters (SFDP) Register
 - 3X256-Bytes Security Registers with OTP locks
 - Volatile & Non-volatile Status Register Bits
- **Space Efficient Packaging**
 - 8-pin SOIC 208-mil

Ordering Information

Part No	Density	Package	Grade
H7A5DM26BACT	128M-bit/16M-byte	8-Pin SOIC 208-mil	Commercial

Pin Configuration

Pin Description (Simplified)

8-Pin SOIC, 208-mil			
Pin NO.	Pin Name	I/O	Function
1	/CS	Input	Chip Select Input
2	DO (IO1)	Input / Output	Data Output (Data Input Output 1)*1
3	/WP (IO2)	Input / Output	Write Protect Input (Data Input Output 2)*2
4	GND		Ground
5	DI (IO0)	Input / Output	Data Input (Data Input Output 0)*1
6	CLK	Input	Serial Clock Input
7	/HOLD or /RESET (IO3)	Input / Output	Hold or Reset Input (Data Input Output 3)(2)
8	VCC		Power Supply

Note1: IO0 and IO1 are used for Standard and Dual SPI instructions and IO0 – IO3 are used for Quad SPI instructions, /WP & /HOLD (or /RESET) functions are only available for Standard/Dual SPI.

Absolute Maximum Rating

Item	Symbol	Conditions	Rating	Unit
Supply Voltage	V _{CC}		-0.6 to VCC+4.6	V
Voltage Applied to Any Pin	V _{IO}	Relative to Ground	-0.6 to VCC+0.4	V
Transient Voltage on any Pin	V _{IOT}	<20nS Transient Relative to Ground	- 2.0V to VCC+2.0V	V
Storage Temperature	T _{STG}		-65 ~ 150	°C
Lead Temperature	T _{LEAD}		Notes2	°C
Electrostatic Discharge Voltage	V _{ESD}	Human Body Model(3)	- 2000 to +2000	V

Note 1: This device has been designed and tested for the specified operation ranges. Proper operation outside of these levels is not guaranteed. Exposure to absolute maximum ratings may affect device reliability. Exposure beyond absolute maximum ratings may cause permanent damage.

Note 2: Compliant with JEDEC Standard J-STD-20C for small body Sn-Pb or Pb-free (Green) assembly and the European directive on restrictions on hazardous substances (RoHS) 2002/95/EU.

Note 3: JEDEC Standard JESD22-A114A (C1=100pF, R1=1500 ohms, R2=500 ohms)..

Operating Ranges

Parameter	Symbol	Conditions	Spec.		Unit
			Min.	Max.	
Supply Voltage	V _{CC}	FR=104MHz,fR=50MHz	2.7	3.6	V
Ambient Temperature, Operating	T _a	Commercial	0	70	°C

Note 1: VCC voltage during Read can operate across the min and max range but should not exceed ±10% of the programming (erase/write) voltage.

Device Power-up / Power-down Timing Requirement

Parameter	Symbol	Spec.		Unit
		Min.	Max.	
VCC (min) to /CS Low	tVSL	20		us
Time Delay Before Write Instruction	tPUW	5		ms
Write Inhibit Threshold Voltage	VWI	1.0	2.0	V

Power-up Timing and Voltage Levels

Power-up, Power-Down Requirement

DC Characteristics

Parameters	Symbol	Conditions	Spec.			Unit
			MIN	TYP	Max	
Input Capacitance	CIN(1)	VIN=0V(1)			6	pF
Output Capacitance	COUT(1)	VOUT=0V(1)			8	pF
Input Leakage	ILI				+/-2	uA
I/O Leakage	ILO				+/-2	uA
Standby Current	ICC1	/CS = VCC, VIN = GND or VCC		10	50	uA
Power-down Current	ICC2	/CS = VCC, VIN = GND or VCC		1	20	uA
Current Read Data / Dual /Quad 50MHz	ICC3	C = 0.1 VCC / 0.9 VCC DO = Open			15	mA
Current Read Data / Dual /Quad 80MHz	ICC3	C = 0.1 VCC / 0.9 VCC DO = Open			18	mA
Current Read Data / Dual /Quad 104MHz	ICC3	C = 0.1 VCC / 0.9 VCC DO = Open			20	mA
Current Write Status Register	ICC4	/CS = VCC		8	12	mA
Current Page Program	ICC5	/CS = VCC		20	25	mA
Current Sector/Block Erase	ICC6	/CS = VCC		20	25	mA
Current Chip Erase	ICC7	/CS = VCC		20	25	mA
Input Low Voltage	VIL		-0.5		0.3 x Vcc	V
Input High Voltage	VIH		0.7 x Vcc		Vcc+0.4	V
Output Low Voltage	VOL	IOL=100uA			0.2	V
Output High Voltage	VOH	IOH = -100 μA	Vcc-0.2			V

Note 1: Tested on sample basis and specified through design and characterization data. TA = 25° C, VCC = 3.0V.

AC Measurement Conditions

Parameter	Symbol	Spec.		Unit
		MIN	Max	
Load Capacitance	CL		30	pF
Input Rise and Fall Times	TR,TF		5	ns
Input Pulse Voltages	VIN	0.1 VCC to 0.9 VCC		V
Input Timing Reference Voltages	IN	0.3 VCC to 0.7 VCC		V
Output Timing Reference Voltages	OUT	0.5 VCC		V

AC Electrical Characteristics

Description	Symbol	ALT	Spec.			Unit
			MIN	TYP	Max	
Clock frequency for all other instructions 2.7V-3.6V VCC except Read data instructions (03h)	FR	fC1	D.C.		104	Mhz
Clock frequency for Read Data instruction (03h)	fR	fC2	D.C		50	Mhz
Clock High, Low Time for all instructions except for Read Data (03h)	tCLH,tCLL(1)		4			ns
Clock High, Low Time for Read Data (03h) instruction	tCRLH, tCRL(1)		8			ns
Clock Rise Time peak to peak	tCLCH(2)		0.1			V/ns
Clock Fall Time peak to peak	tCHCL(2)		0.1			V/ns
/CS Active Setup Time relative to CLK	tSLCH	tCSS	5			ns
/CS Not Active Hold Time relative to CLK	tCHSL		5			ns
Data In Setup Time	tDVCH	tDSU	2			ns
Data In Hold Time	tCHDX	tDH	3			ns
/CS Active Hold Time relative to CLK	tCHSH		3			ns
/CS Not Active Setup Time relative to CLK	tSHCH		3			ns
/CS Deselect Time(for Read)	tSHSL1	tCSH	10			ns
/CS Deselect Time (for Erase or Program or write)	tSHSL2	tCSH	50			ns

Clock Low to Output Valid	tCLQV1	tV			7	ns
Output Hold Time	tCLQX	tHO	2			ns
/HOLD Active Setup Time relative to CLK	tHLCH		5			ns
/HOLD Active Hold Time relative to CLK	tCHHH		5			ns
/HOLD Not Active Setup Time relative to CLK	tHHCH		5			ns
/HOLD Not Active Hold Time relative to CLK	tCHHL		5			ns
/HOLD to Output Low-Z	tHHQX(2)	tLZ			7	ns
/HOLD to Output High-Z	tHLQZ(2)	tHZ			12	ns
Write Protect Setup Time Before /CS Low	tWHSL(3)		20			ns
Write Protect Hold Time After /CS High	tSHWL(3)		100			ns
/CS High to Power-down Mode	tDP(2)				3	us
/CS High to Standby Mode without ID Read	tRES1(2)				3	us
/CS High to Standby Mode with ID Read	tRES2(2)				1.8	us
/CS High to next Instruction after Suspend	tSUS(2)				20	us
/CS High to next Instruction after Reset	tSUS(2)				30	us
/RESET pin Low period to reset the device	tRST(2)		1			us
Status Register Write Time	tw			10	15	ms
Byte Program Time (First Byte) (4)	tBP1			30	50	us
Additional Byte Program Time (After First Byte) (4)	tBP2			2.5	12	us
Page Program, OTP Lock, BBM Management Time	tPP			0.7	3	ms

Sector Erase Time (4KB)	tSE		45-100	400	ms
Block Erase Time (32KB)	tBE1		120	1600	ms
Block Erase Time (64KB)	tBE2		150	2000	ms
Chip Erase Time	tCE		40	200	s

Note: 1. Clock high + Clock low must be less than or equal to $1/f_C$.

Note: 2. Value guaranteed by design and/or characterization, not 100% tested in production.

Note: 3. Only applicable as a constraint for a Write Status Register instruction when SRP[1:0]=(0,1).

Note: 4. For multiple bytes after first byte within a page, $t_{BPN} = t_{BP1} + t_{BP2} * N$ (typical) and $t_{BPN} = t_{BP1} + t_{BP2} * N$ (max), where N = number of bytes programmed.

Note: 5. It is possible to reset the device with shorter tRESET (as short as a few hundred ns), a 1us minimum is recommended to ensure reliable operation.

Note: 6. 4-bytes address alignment for QPI/SPI Quad Read

/Hold Timing

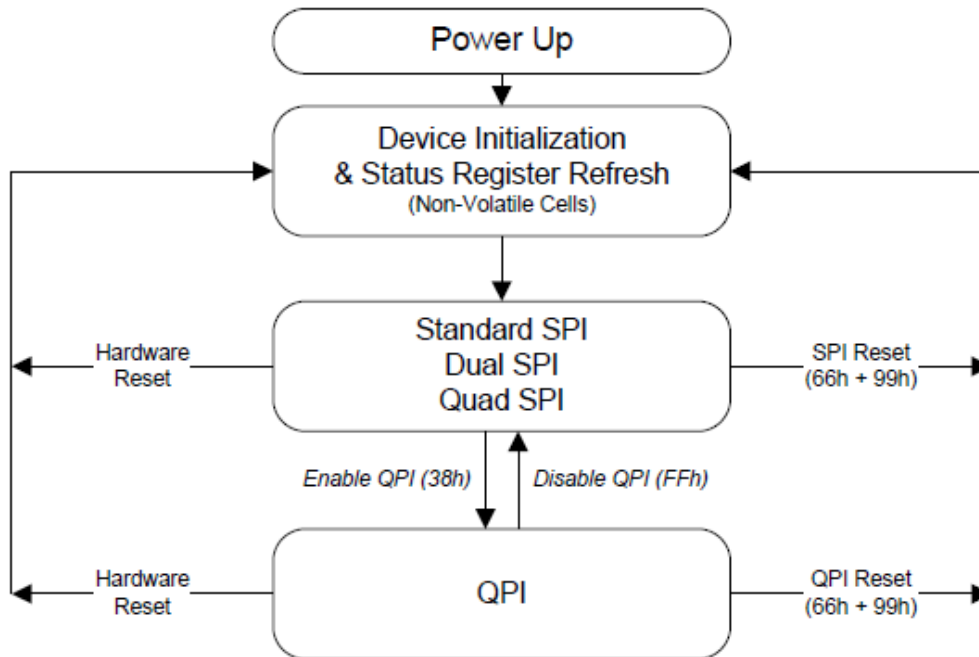

W/P Timing

Block Diagram

SPI/QPI Operation

Standard SPI Instructions

The H7A5DM26BACT is accessed through an SPI compatible bus consisting of four signals: Serial Clock (CLK), Chip Select (/CS), Serial Data Input (DI) and Serial Data Output (DO). Standard SPI instructions use the DI input pin to serially write instructions, addresses or data to the device on the rising edge of CLK. The DO output pin is used to read data or status from the device on the falling edge of CLK.

SPI bus operation Mode 0 (0,0) and 3 (1,1) are supported. The primary difference between Mode 0 and Mode 3 concerns the normal state of the CLK signal when the SPI bus master is in standby and data is not being transferred to the Serial Flash. For Mode 0, the CLK signal is normally low on the falling and rising edges of /CS. For Mode 3, the CLK signal is normally high on the falling and rising edges of /CS.

Dual SPI Instructions

The H7A5DM26BACT supports Dual SPI operation when using instructions such as “Fast Read Dual Output (3Bh)” and “Fast Read Dual I/O (BBh)”. These instructions allow data to be transferred to or from the device at two to three times the rate of ordinary Serial Flash devices. The Dual SPI Read instructions are ideal for quickly downloading code to RAM upon power-up (code-shadowing) or for executing non-speed-critical code directly from the SPI bus (XIP). When using Dual SPI instructions, the DI and DO pins become bidirectional I/O pins: IO0 and IO1.

Quad SPI Instructions

The H7A5DM26BACT supports Quad SPI operation when using instructions such as “Fast Read Quad Output (6Bh)”, “Fast Read Quad I/O (EBh)”, “Word Read Quad I/O (E7h)” and “Octal Word Read Quad I/O (E3h)”. These instructions allow data to be transferred to or from the device four to six times the rate of ordinary Serial Flash. The Quad Read instructions offer a significant improvement in continuous and random access transfer rates allowing fast code-shadowing to RAM or execution directly from the SPI bus (XIP). When using Quad SPI instructions the DI and DO pins become bidirectional IO0 and IO1, and the /WP and /HOLD pins become IO2 and IO3 respectively. Quad SPI instructions require the non-volatile Quad Enable bit (QE) in Status Register-2 to be set.

QPI Instructions

The H7A5DM26BACT supports Quad Peripheral Interface (QPI) operations only when the device is switched from Standard/Dual/Quad SPI mode to QPI mode using the “Enter QPI (38h)” instruction. The typical SPI protocol requires that the byte-long instruction code being shifted into the device only via DI pin in eight serial clocks. The QPI mode utilizes all four IO pins to input the instruction code, thus only two serial clocks are required. This can significantly reduce the SPI instruction overhead and improve system performance in an XIP environment. Standard/Dual/Quad SPI mode and QPI mode are exclusive. Only one mode can be active at any given time. “Enter QPI (38h)” and “Exit QPI (FFh)” instructions are used to switch between these two modes. Upon power-up or after a software reset using “Reset (99h)” instruction, the default state of the device is Standard/Dual/Quad SPI mode. To enable QPI mode, the non-volatile Quad Enable bit (QE) in Status Register-2 is required to be set. When using QPI instructions, the DI and DO pins become bidirectional IO0 and IO1, and the /WP and /HOLD pins become IO2 and IO3 respectively.

Hold Function

For Standard SPI and Dual SPI operations, the /HOLD signal allows the H7A5DM26BACT operation to be paused while it is actively selected (when /CS is low). The /HOLD function may be useful in cases where the SPI data and clock signals are shared with other devices. For example, consider if the page buffer was only partially written when a priority interrupt requires use of the SPI bus. In this case the /HOLD function can save the state of the instruction and the data in the buffer so programming can resume where it left off once the bus is available again. The /HOLD function is only available for standard SPI and Dual SPI operation, not during Quad SPI or QPI. The Quad Enable Bit QE in Status Register-2 is used to determine if the pin is used as /HOLD pin or data I/O pin. When QE=0 (factory default), the pin is /HOLD, when QE=1, the pin will become an I/O pin, /HOLD function is no longer available.

To initiate a /HOLD condition, the device must be selected with /CS low. A /HOLD condition will activate on the falling edge of the /HOLD signal if the CLK signal is already low. If the CLK is not already low the /HOLD condition will activate after the next falling edge of CLK. The /HOLD condition will terminate on the rising edge of the /HOLD signal if the CLK signal is already low. If the CLK is not already low the /HOLD condition will terminate after the next falling edge of CLK. During a /HOLD condition, the Serial Data Output (DO) is high impedance, and Serial Data Input (DI) and Serial Clock (CLK) are ignored. The Chip Select (/CS) signal should be kept active (low) for the full duration of the /HOLD operation to avoid resetting the internal logic state of the device.

Write Protection

Applications that use non-volatile memory must take into consideration the possibility of noise and other adverse system conditions that may compromise data integrity. To address this concern, the H7A5DM26BACT provides several means to protect the data from inadvertent writes.

- ◆ Device resets when VCC is below threshold
- ◆ Time delay write disable after Power-up
- ◆ Write enable/disable instructions and automatic write disable after erase or program
- ◆ Software and Hardware (/WP pin) write protection using Status Registers
- ◆ Additional Individual Block/Sector Locks for array protection
- ◆ Write Protection using Power-down instruction
- ◆ Lock Down write protection for Status Register until the next power-up
- ◆ One Time Program (OTP) write protection for array and Security Registers using Status Register

Upon power-up or at power-down, the H7A5DM26BACT will maintain a reset condition while VCC is below the threshold value of VWI. While reset, all operations are disabled and no instructions are recognized. During power-up and after the VCC voltage exceeds VWI, all program and erase related instructions are further disabled for a time delay of tPUW. This includes the Write Enable, Page Program, Sector Erase, Block Erase, Chip Erase and the Write Status Register instructions. Note that the chip select pin (/CS) must track the VCC supply level at power-up until the VCC-min level and tVSL time delay is reached., and it must also track the VCC supply level at power-down to prevent adverse command sequence. If needed a pull-up resistor on /CS can be used to accomplish this.

After power-up the device is automatically placed in a write-disabled state with the Status Register Write Enable Latch (WEL) set to a 0. A Write Enable instruction must be issued before a Page Program, Sector Erase, Block Erase, Chip Erase or Write Status Register instruction will be accepted. After completing a program, erase or write instruction the Write Enable Latch (WEL) is automatically cleared to a write-disabled state of 0.

Software controlled write protection is facilitated using the Write Status Register instruction and setting the Status Register Protect (SRP0, SRP1) and Block Protect (CMP, SEC, TB, BP[2:0]) bits. These settings allow a portion or the entire memory array to be configured as read only. Used in conjunction with the Write Protect (/WP) pin, changes to the Status Register can be enabled or disabled under hardware control. See Status Register section for further information. Additionally, the Power-down instruction offers an extra level of write protection as all instructions are ignored except for the Release Power-down instruction.

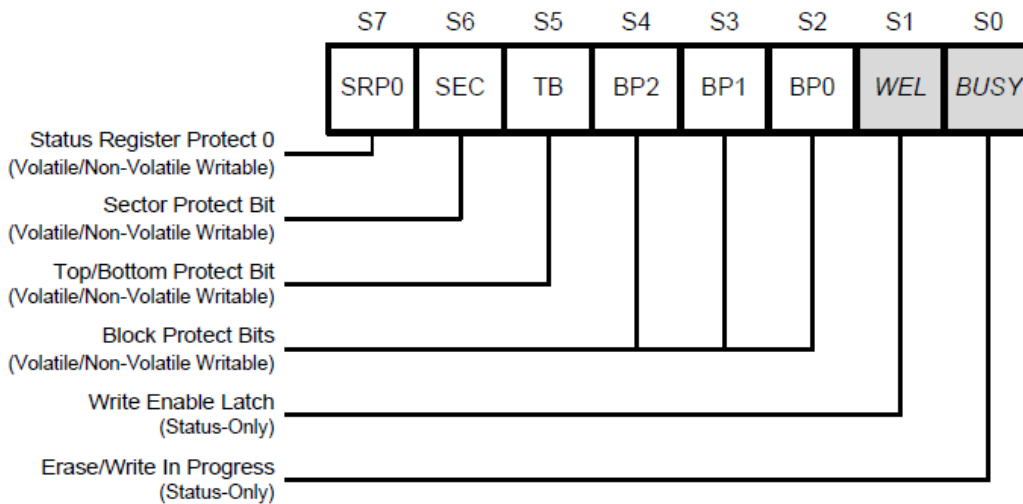

The H7A5DM26BACT also provides another Write Protect method using the Individual Block Locks. Each 64KB block (except the top and bottom blocks, total of 510 blocks) and each 4KB sector within the top/bottom blocks (total of 32 sectors) are equipped with an Individual Block Lock bit. When the lock bit is 0, the corresponding sector or block can be erased or programmed; when the lock bit is set to 1, Erase or Program commands issued to the corresponding sector or block will be ignored. When the device is powered on, all Individual Block Lock bits will be 1, so the entire memory array is protected from Erase/Program. An "Individual Block Unlock (39h)" instruction must be issued to unlock any specific sector or block.

The WPS bit in Status Register-3 is used to decide which Write Protect scheme should be used. When WPS=0 (factory default), the device will only utilize CMP, SEC, TB, BP[2:0] bits to protect specific areas of the array; when WPS=1, the device will utilize the Individual Block Locks for write protection.

Status and Configuration Registers

Three Status and Configuration Registers are provided for H7A5DM26BACT. The Read Status Register-1/2/3 instructions can be used to provide status on the availability of the flash memory array, whether the device is write enabled or disabled, the state of write protection, Quad SPI setting, Security Register lock status, Erase/Program Suspend status, output driver strength, power-up. The Write Status Register instruction can be used to configure the device write protection features, Quad SPI setting, Security Register OTP locks, Hold/Reset functions, output driver strength. Write access to the Status Register is controlled by the state of the non-volatile Status Register Protect bits (SRP0, SRP1), the Write Enable instruction, and during Standard/Dual SPI operations, the /WP pin.

Status Register-1

Erase/Write In Progress (BUSY) – Status Only

BUSY is a read only bit in the status register (S0) that is set to a 1 state when the device is executing a Page Program, Quad Page Program, Sector Erase, Block Erase, Chip Erase, Write Status Register or Erase/Program Security Register instruction. During this time the device will ignore further instructions except for the Read Status Register and Erase/Program Suspend instruction (see tW, tPP, tSE, tBE, and tCE in AC Characteristics). When the program, erase or write status/security register instruction has completed, the BUSY bit will be cleared to a 0 state indicating the device is ready for further instructions.

Write Enable Latch (WEL) – Status Only

Write Enable Latch (WEL) is a read only bit in the status register (S1) that is set to 1 after executing a Write Enable Instruction. The WEL status bit is cleared to 0 when the device is write disabled. A write disable state occurs upon power-up or after any of the following instructions: Write Disable, Page Program, Quad Page Program, Sector Erase, Block Erase, Chip Erase, Write Status Register, Erase Security Register and Program Security Register.

Block Protect Bits (BP2, BP1, BP0) – Volatile/Non-Volatile Writable

The Block Protect Bits (BP2, BP1, BP0) are non-volatile read/write bits in the status register (S4, S3, and S2) that provide Write Protection control and status. Block Protect bits can be set using the Write Status Register Instruction (see tW in AC characteristics). All, none or a portion of the memory array can be protected from Program and Erase instructions (see Status Register Memory Protection table). The factory default setting for the Block Protection Bits is 0, none of the array protected.

Top/Bottom Block Protect (TB) – Volatile/Non-Volatile Writable

The non-volatile Top/Bottom bit (TB) controls if the Block Protect Bits (BP2, BP1, BP0) protect from the Top (TB=0) or the Bottom (TB=1) of the array as shown in the Status Register Memory Protection table. The factory default setting is TB=0. The TB bit can be set with the Write Status Register Instruction depending on the state of the SRP0, SRP1 and WEL bits.

Sector/Block Protect Bit (SEC) – Volatile/Non-Volatile Writable

The non-volatile Sector/Block Protect bit (SEC) controls if the Block Protect Bits (BP2, BP1, BP0) protect either 4KB Sectors (SEC=1) or 64KB Blocks (SEC=0) in the Top (TB=0) or the Bottom (TB=1) of the array as shown in the Status Register Memory Protection table. The default setting is SEC=0.

Complement Protect (CMP) – Volatile/Non-Volatile Writable

The Complement Protect bit (CMP) is a non-volatile read/write bit in the status register (S14). It is used in conjunction with SEC, TB, BP2, BP1 and BP0 bits to provide more flexibility for the array protection. Once CMP is set to 1, previous array protection set by SEC, TB, BP2, BP1 and BP0 will be reversed. For instance, when CMP=0, a top 64KB block can be protected while the rest of the array is not; when CMP=1, the top 64KB block will become unprotected while the rest of the array become read-only. Please refer to the Status Register Memory Protection table for details. The default setting is CMP=0.

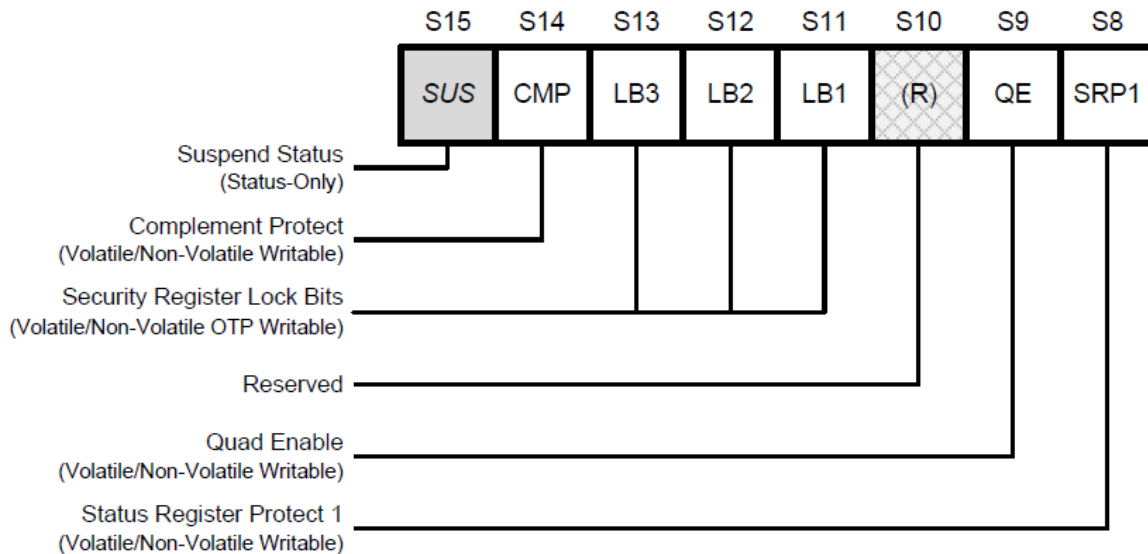

Status Register Protect (SRP1, SRP0) – Volatile/Non-Volatile Writable

The Status Register Protect bits (SRP1 and SRP0) are non-volatile read/write bits in the status register (S8 and S7). The SRP bits control the method of write protection: software protection, hardware protection, power supply lock-down or one time programmable (OTP) protection.

SRP1	SRP0	/WP	Status Register	Descriptions
0	0	X	Software Protection	/WP pin has no control. The Status register can be written to after a Write Enable instruction, WEL=1. [Factory Default]
0	1	0	Hardware Protected	When /WP pin is low the Status Register locked and cannot be written to.
0	1	1	Hardware Unprotected	When /WP pin is high the Status register is unlocked and can be written to after a Write Enable instruction, WEL=1.
1	0	X	Power Supply Lock-Down	Status Register is protected and cannot be written to again until the next power-down, power-up cycle.(1)
1	1	X	One Time Program(2)	Status Register is permanently protected and cannot be written to.

Note: 1. When SRP1, SRP0 = (1, 0), a power-down, power-up cycle will change SRP1, SRP0 to (0, 0) state.

Status Register-2

Erase/Program Suspend Status (SUS) – Status Only

The Suspend Status bit is a read only bit in the status register (S15) that is set to 1 after executing a Erase/Program Suspend (75h) instruction. The SUS status bit is cleared to 0 by Erase/Program Resume (7Ah) instruction as well as a power-down, power-up cycle.

Security Register Lock Bits (LB[3:1]) – Volatile/Non-Volatile OTP Writable

The Security Register Lock Bits (LB3, LB2, LB1) are non-volatile One Time Program (OTP) bits in Status Register (S13, S12, S11) that provide the write protect control and status to the Security Registers. The default state of LB3-1 is 0, Security Registers are unlocked. LB3-1 can be set to 1 individually using the Write Status Register instruction. LB3-1 are One Time Programmable (OTP), once it's set to 1, the corresponding 256-Byte Security Register will become read-only permanently.

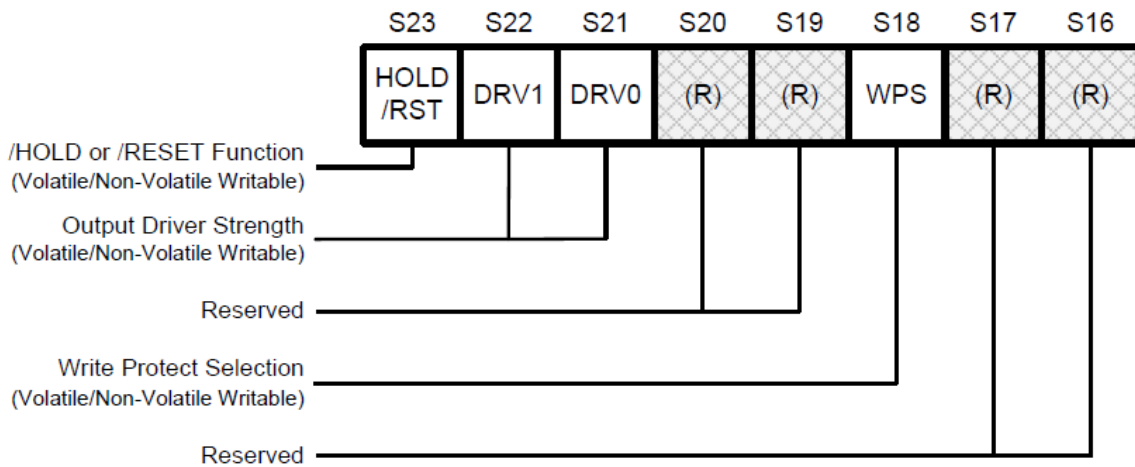

Quad Enable (QE) – Volatile/Non-Volatile Writable

The Quad Enable (QE) bit is a non-volatile read/write bit in the status register (S9) that allows Quad SPI and QPI operation. When the QE bit is set to a 0 state, the /WP pin and /HOLD are enabled. When the QE bit is set to a 1, the Quad IO2 and IO3 pins are enabled, and /WP and /HOLD functions are disabled.

QE bit is required to be set to a 1 before issuing an “Enter QPI (38h)” to switch the device from Standard/Dual/Quad SPI to QPI, otherwise the command will be ignored. When the device is in QPI mode, QE bit will remain to be 1. A “Write Status Register” command in QPI mode cannot change QE bit from a “1” to a “0”.

WARNING: If the /WP or /HOLD pins are tied directly to the power supply or ground during standard SPI or Dual SPI operation, the QE bit should never be set to a 1.

Status Register-3

Write Protect Selection (WPS) – Volatile/Non-Volatile Writable

The WPS bit is used to select which Write Protect scheme should be used. When WPS=0, the device will use the combination of CMP, SEC, TB, BP[2:0] bits to protect a specific area of the memory array. When WPS=1, the device will utilize the Individual Block Locks to protect any individual sector or blocks. The default value for all Individual Block Lock bits is 1 upon device power on or after reset.

Output Driver Strength (DRV1, DRV0) – Volatile/Non-Volatile Writable

The DRV1 & DRV0 bits are used to determine the output driver strength for the Read operations.

DRV1, DRV0	Driver Strength
0,0	100%
0,1	75%
1,0	50%
1,1	25%(default)

/HOLD or /RESET Pin Function (HOLD/RST) – Volatile/Non-Volatile Writable

The HOLD/RST bit is used to determine whether /HOLD or /RESET function should be implemented on the hardware pin for 8-pin packages. When HOLD/RST=0 (factory default), the pin acts as /HOLD; when HOLD/RST=1, the pin acts as /RESET. However, /HOLD or /RESET functions are only available when QE=0. If QE is set to 1, the /HOLD and /RESET functions are disabled, the pin acts as a dedicated data I/O pin.

Status Register Memory Protection(WPS=0, CMP=0)

STATUS REGISTER					(128M-BIT / 16M-BYTE) MEMORY PROTECTION			
SEC	TB	BP2	BP1	BP0	PROTECTED BLOCK(S)	PROTECTED ADDRESS	PROTECTED DENSITY	PROTECTED PORTION
X	X	0	0	0	None	None	None	None
0	0	0	0	1	252 thru 255	FC0000h – FFFFFFFh	256KB	Upper 1/64
0	0	0	1	0	248 thru 255	F80000h – FFFFFFFh	512KB	Upper 1/32

1	1	1	0	X	0 thru 255	008000h - FFFFFFFh	16,352KB	U - 511/512

Note: 1. X = don't care.

Note: 2. If any Erase or Program command specifies a memory region that contains protected data portion, this command will be ignored.

Individual Block Memory Protection (WPS=1)

Note: 1. Individual Block/Sector protection is only valid when WPS=1.

Note: 2. All individual block/sector lock bits are set to 1 by default after power up, all memory array is protected.

Erase / Program Resume	7Ah					
Power-down	B9h					
Enable Reset	66h					
Reset Device	99h					
Exit QPI Mode	FFh					

Note 1: Data bytes are shifted with Most Significant Bit first. Byte fields with data in parenthesis “()” indicate data output from the device on either 1, 2 or 4 IO pins.

Note 2: The Status Register contents and Device ID will repeat continuously until /CS terminates the instruction.

Note 3: At least one byte of data input is required for Page Program, Quad Page Program and Program Security Registers, up to 256 bytes of data input. If more than 256 bytes of data are sent to the device, the addressing will wrap to the beginning of the page and overwrite previously sent data.

Note 4: Write Status Register-1 (01h) can also be used to program Status Register-1&2

Note 5: Security Register Address:

Status Register 1 : A23-16 = 00h; A15-8 = 10h; A7-0 = byte address

Status Register 2 : A23-16 = 00h; A15-8 = 20h; A7-0 = byte address

Status Register 3 : A23-16 = 00h; A15-8 = 30h; A7-0 = byte address

Note 6: Dual SPI address input format:

IO0 = A22, A20, A18, A16, A14, A12, A10, A8 A6, A4, A2, A0, M6, M4, M2, M0

IO1 = A23, A21, A19, A17, A15, A13, A11, A9 A7, A5, A3, A1, M7, M5, M3, M1

Note 7: Dual SPI data output format:

IO0 = (D6, D4, D2, D0)

IO1 = (D7, D5, D3, D1)

Note 8: Quad SPI address input format:

IO0 = A20, A16, A12, A8, A4, A0, M4, M0

IO1 = A21, A17, A13, A9, A5, A1, M5, M1

IO2 = A22, A18, A14, A10, A6, A2, M6, M2

IO3 = A23, A19, A15, A11, A7, A3, M7, M3

Set Burst with Wrap input format:

IO0 = x, x, x, x, x, x, W4, x

IO1 = x, x, x, x, x, x, W5, x

IO2 = x, x, x, x, x, x, W6, x

IO3 = x, x, x, x, x, x, x, x

Note 9: Quad SPI data input/output format:

IO0 = (D4, D0,)

IO1 = (D5, D1,)

IO2 = (D6, D2,)

IO3 = (D7, D3,)

Note 10: Fast Read Quad I/O data output format:

IO0 = (x, x, x, x, D4, D0, D4, D0)

IO1 = (x, x, x, x, D5, D1, D5, D1)

IO2 = (x, x, x, x, D6, D2, D6, D2)

IO3 = (x, x, x, x, D7, D3, D7, D3)

Note 11: Word Read Quad I/O data output format:

IO0 = (x, x, D4, D0, D4, D0, D4, D0)

IO1 = (x, x, D5, D1, D5, D1, D5, D1)

IO2 = (x, x, D6, D2, D6, D2, D6, D2)

IO3 = (x, x, D7, D3, D7, D3, D7, D3)

Note 12: QPI Command, Address, Data input/output format:

CLK # 0 1 2 3 4 5 6 7 8 9 10 11

IO0 = C4, C0, A20, A16, A12, A8, A4, A0, D4, D0, D4, D0

IO1 = C5, C1, A21, A17, A13, A9, A5, A1, D5, D1, D5, D1

IO2 = C6, C2, A22, A18, A14, A10, A6, A2, D6, D2, D6, D2

IO3 = C7, C3, A23, A19, A15, A11, A7, A3, D7, D3, D7, D3

Note 13: The number of dummy clocks for QPI Fast Read, QPI Fast Read Quad I/O & QPI Burst Read with Wrap is controlled by read parameter P7 – P4.

Note 14: The wrap around length for QPI Burst Read with Wrap is controlled by read parameter P3 – P0.
