

## **4Gb (16Mx8Banksx32) Low Power DDR3 SDRAM**

### **Descriptions**

This LPDDR3 is a high-speed SDRAM device internally configured as an 8-Bank memory and contains 4,294,967,296 bits.

This LPDDR3 device uses a double data rate architecture on the Command/Address (CA) bus to reduce the number of input pins in the system. The 10-bit CA bus contains command, address, and Bank/Row Buffer information. Each command uses one clock cycle, during which command information is transferred on both the positive and negative edge of the clock.

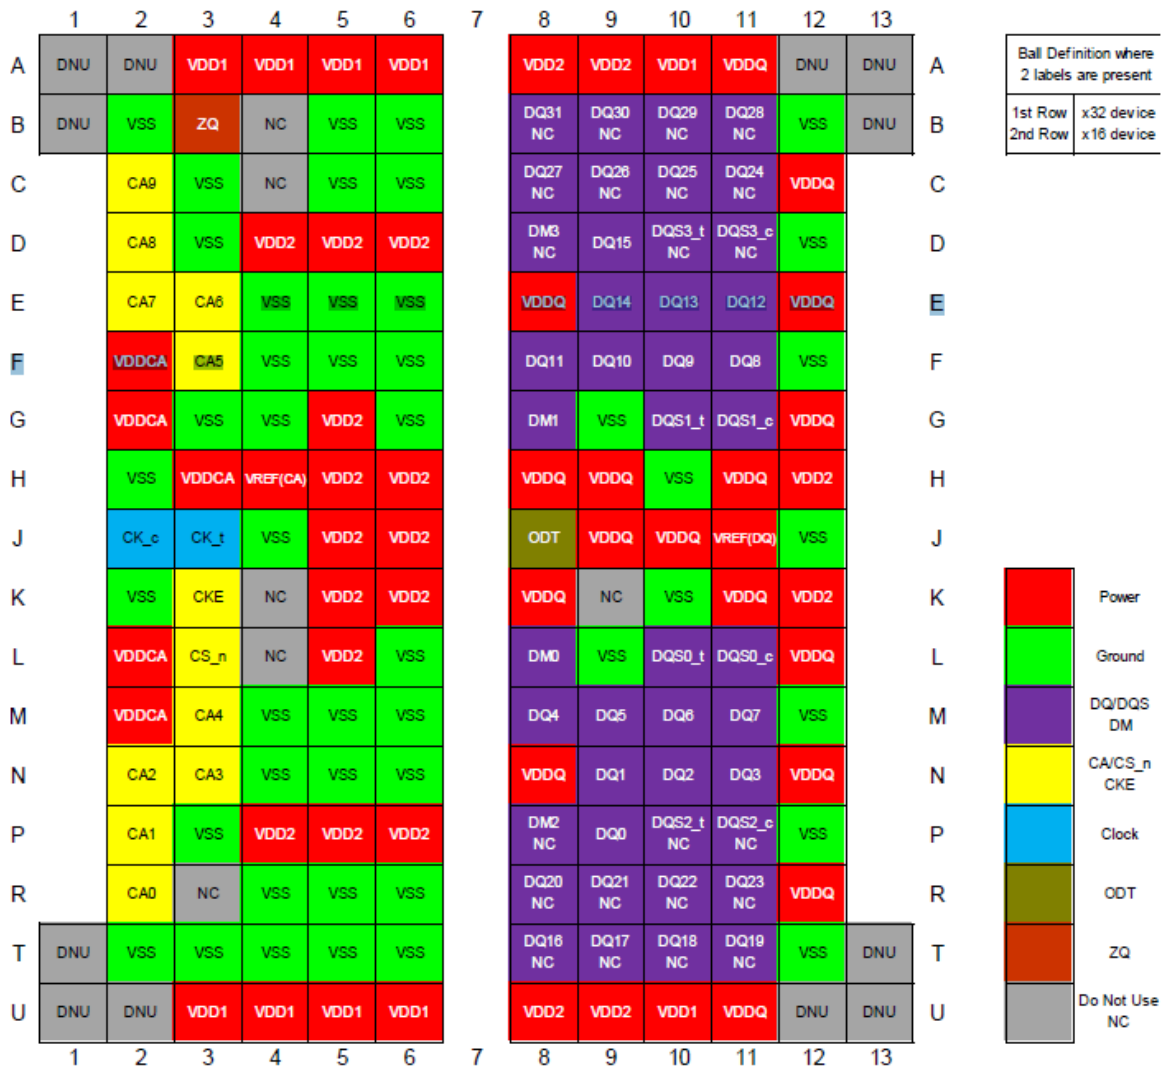

### **Features**

- VDD1 = 1.7~1.95V
- VDD2/VDDCA/ VDDQ = 1.14V~1.30V
- Data width: x32
- Clock rate: up to 933 MHz
- Data rate: up to 1866 Mbps
- 8 internal banks for concurrent operation
- 8n pre-fetch operation
- Burst length: 8
- Per Bank Refresh
- Partial Array Self-Refresh(PASR)
- On-die termination (ODT)
- Deep Power Down Mode (DPD Mode)
- Double data rate architecture
- Clock Stop capability
- Programmable Read and Write Latencies (RL/WL)
- Bidirectional differential data strobe
- VFBGA178 (11mm x11.5mm)

## Ordering Information

Part No	Organization	Max. Data Rate	Package	Grade
H2A804G32B6BFHC	128M X 32	LPDDR3-1600	178Ball	Commercial
H2A804G32B6BGHC	128M X 32	LPDDR3-1866	BGA,11x11.5mm	Commercial

## Pin Assignment

178-Ball FBGA

## Pin Description (Simplified)

Name	Type	Description
CK_t, CK_c	Input	<b>Clock:</b> CK_t and CK_c are differential clock inputs. All Double Data Rate (DDR) CA inputs are sampled on both positive and negative edge of CK_t. Single Data Rate (SDR) inputs, CS_n and CKE, are sampled at the positive Clock edge. Clock is defined as the differential pair, CK_t and CK_c. The positive Clock edge is defined by the crosspoint of a rising CK_t and a falling CK_c. The negative Clock edge is defined by the crosspoint of a falling CK_t and a rising CK_c.
CKE	Input	<b>Clock Enable:</b> CKE HIGH activates and CKE LOW deactivates internal clock signals and therefore device input buffers and output drivers. Power savings modes are entered and exited through CKE transitions. CKE is considered part of the command code. See 7.5.1 "Command Truth Table" for command code descriptions. CKE is sampled at the positive Clock edge.
CS_n	Input	<b>Chip Select:</b> CS_n is considered part of the command code. See 7.5.1 "Command Truth Table" for command code descriptions. CS_n is sampled at the positive Clock edge.
CA[n:0]	Input	<b>DDR Command/Address Inputs:</b> Uni-directional command/address bus inputs. CA is considered part of the command code. See 7.5.1 "Command Truth Table" for command code descriptions.
DQ[n:0]	I/O	<b>Data Inputs/Output:</b> Bi-directional data bus. DQ[15:0] for x16, DQ[31:0] for x32.
DQSn_t, DQSn_c	I/O	<b>Data Strobe (Bi-directional, Differential):</b> The data strobe is bi-directional (used for read and write data) and differential (DQS_t and DQS_c). It is output with read data and input with write data. DQS_t is edge-aligned to read data and centered with write data. For x16, DQS0_t and DQS0_c correspond to the data on DQ0-7; DQS1_t and DQS1_c to the data on DQ8-15. For x32 DQS0_t and DQS0_c correspond to the data on DQ0-7; DQS1_t and DQS1_c to the data on DQ8-15; DQS2_t and DQS2_c to the data on DQ16-23; DQS3_t and DQS3_c to the data on DQ24-31.
DMn	Input	<b>Input Data Mask:</b> DM is the input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS_t. Although DM is for input only, the DM loading shall match the DQ and DQS (or DQS_c). For x16 and x32 devices, DM0 is the input data mask signal for the data on DQ0-7. DM1 is the input data mask signal for the data on DQ8-15. For x32 devices, DM2 is the input data mask signal for the data on DQ16-23 and DM3 is the input data mask signal for the data on DQ24-31.
ODT	Input	<b>On-Die Termination:</b> This signal enables and disables termination on the DRAM DQ bus according to the specified mode register settings.
VDD1	Supply	<b>Core Power Supply 1:</b> Core Power supply.
VDD2	Supply	<b>Core Power Supply 2:</b> Core Power supply.
VDDCA	Supply	<b>Input Receiver Power Supply:</b> Power supply for CA[9:0], CKE, CS_n, CK_t, and CK_c input buffers.
VDDQ	Supply	<b>I/O Power Supply:</b> Power supply for Data input/output buffers.
VREF(CA)	Supply	<b>Reference Voltage for CA Command and Control Input Receiver:</b> Reference voltage for all CA[9:0], CKE, CS_n, CK_t, and CK_c input buffers.
VREF(DQ)	Supply	<b>Reference Voltage for DQ Input Receiver:</b> Reference voltage for all Data input buffers.
VSS	Supply	<b>Ground:</b> Ground of core logic, input receivers and data input/output buffers.
ZQ	I/O	<b>Reference Pin for Output Drive Strength Calibration</b>
NC	--	<b>No Connection</b>
DNU	--	<b>Do Not Use</b>

**Note 1:** Data includes DQ and DM.

## Absolute Maximum DC Rating

Symbol	Item	Rating	Units
V <sub>IN</sub> , V <sub>OUT</sub>	Voltage on any pin relative	-0.4 ~ 1.6	V
V <sub>DD1</sub>	Voltage on VDD1 pin relative	-0.4 ~ 2.3	V
V <sub>DD2</sub>	Voltage on VDD2 pin relative	-0.4 ~ 1.6	V
V <sub>DDCA</sub>	Voltage on VDDCA pin relative	-0.4 ~ 1.6	V
V <sub>DDQ</sub>	Voltage on VDDQ pin relative	-0.4 ~ 1.6	V
T <sub>STG</sub>	Storage Temperature (plastic)	-55 ~ 125	°C

**Note 1:** See “Voltage Ramp and Device Initialization” for relationships between power supplies.

**Note 2:** VREFCA ≤ 0.6 x VDDCA; however, VREFCA may be ≥ VDDCA provided that VREFCA ≤ 300mV.

**Note 3:** VREFDQ ≤ 0.7 x VDDQ; however, VREFDQ may be ≥ VDDQ provided that VREFDQ ≤ 300mV.

**Note 4:** Storage temperature is the case surface temperature on the center/top side of the LPDDR3 device.  
The measurement conditions is defined by JESD51-2 standard.

## Capacitance

Parameter	Symbol	Min	Max	Units	Note
Package Input capacitance, CK <sub>t</sub> and CK <sub>c</sub>	CPKGCK	0.5	1.5	pF	1, 2
Package Input capacitance delta, CK <sub>t</sub> and CK <sub>c</sub>	CDPKGCK	0	0.15	pF	1, 2, 3
Package Input capacitance, all other input-only pins	CPKGI	0.5	1.5	pF	1, 2, 4
Package Input capacitance delta, all other input-only pins	CDPKGI	-0.2	0.2	pF	1, 2, 5
Package Input/output capacitance, DQ, DM, DQS <sub>t</sub> , DQS <sub>c</sub>	CPKGIO	1.0	2.4	pF	1, 2, 6, 7
Package Input/output capacitance delta, DQS <sub>t</sub> , DQS <sub>c</sub>	CDPKGDQS	0	0.2	pF	1, 2, 7, 8
Package Input/output capacitance delta, DQ, DM	CDPKGIO	-0.25	0.25	pF	1, 2, 7, 9
Package Input/output capacitance, ZQ Pin	CPKGZQ	0	2.4	pF	1, 2

(TOPER; VDDQ = 1.14-1.3V; VDDCA = 1.14-1.3V; VDD1 = 1.7-1.95V, VDD2 = 1.14-1.3V).

**Note 1:** This parameter is not subject to production test. It is verified by design and characterization. The capacitance is measured according to JEP147 (Procedure for measuring input capacitance using a vector network analyzer (VNA) with VDD1, VDD2, VDDQ, VSS applied and all other pins floating.

**Note 2:** Absolute value of CPKGCK<sub>t</sub> - CPKGCK<sub>c</sub>.

**Note 3:** CPKGI applies to CS<sub>n</sub>, CE, CA0-CA9, ODT

**Note 4:** CDPKGI = CPKGI - 0.5 \* (CPKGCK<sub>t</sub> + CPKGCK<sub>c</sub>).

**Note 5:** DM loading matches DQ and DQS.

**Note 6:** MR3 I/O configuration DS OP3-OP0 = 0001b (34.3 Ω typical).

**Note 7:** Absolute value of CDPKGDQS<sub>t</sub> and CDPKGDQS<sub>c</sub>.

**Note 8:** CDPKGIO = CPKGIO - 0.5 \* (CDPKGDQS<sub>t</sub> + CDPKGDQS<sub>c</sub>) in byte lane.

## Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Units
V <sub>DD1</sub>	Core Supply voltage 1	1.70	1.80	1.95	V
V <sub>DD2</sub>	Core Supply voltage 2	1.14	1.20	1.30	V
V <sub>DCCA</sub>	Input Supply Voltage (Command/Address)	1.14	1.20	1.30	V
V <sub>DDQ</sub>	I/O Supply voltage (DQ)	1.14	1.20	1.30	V

**Notes: 1.** The voltage range is for DC voltage only. DC is defined as the voltage supplied at the DRAM and is inclusive of all noise up to 1 MHz at the DRAM package ball.

**Notes: 2.** VDD1 uses significantly less power than VDD2.

## DC Characteristics

(IDD Specifications; VDD2, VDDQ, VDDCA = 1.14~1.30V, VDD1 = 1.70~1.95V)

Parameter/Condition	Symbol	Power Supply	800 MHz	933 MHz	Unit	Notes
<b>Operating one bank active-precharge current:</b> tCK = tCKmin; tRC = tRCmin; CKE is HIGH; CS_n is HIGH between valid commands; CA bus inputs are switching; Data bus inputs are stable ODT disabled	IDD01	VDD1	15	18	mA	
	IDD02	VDD2	70	75	mA

<b>Deep power-down current:</b> CK_t = LOW, CK_c = HIGH; CKE is LOW; CA bus inputs are stable; Data bus inputs are stable ODT disabled	IDD81	VDD1	50	50	μA	
	IDD82	VDD2	50	50	μA	
	IDD8,in	VDDCA VDDQ	50	50	μA	4

**Note 1:** Published IDD values are the maximum of the distribution of the arithmetic mean.

**Note 2:** ODT disabled: MR11[2:0] = 000b.

**Note 3:** IDD current specifications are tested after the device is properly initialized.

**Note 4:** Measured currents are the summation of VDDQ and VDDCA.

**Note 5:** For all IDD measurements, VIHCKE = 0.8 x VDDCA, VILCKE = 0.2 x VDDCA.

IDD6 Partial Array Self-refresh current; VDD2, VDDQ, VDDCA = 1.14~1.30V, VDD1 = 1.70~1.95V

Parameter	Symbol	Power Supply	800 MHz	933 MHz	Condition	Unit	
IDD6 Partial Array Self-Refresh Current	Full Array	IDD6 <sub>1</sub>	VDD1	2000	2500	<b>Self refresh current</b> CK_t=LOW, CK_c=HIGH; CKE is LOW; CA bus inputs are stable; Data bus inputs are stable; ODT disabled	μA
		IDD6 <sub>2</sub>	VDD2	7500	10000		
		IDD6 <sub>IN</sub>	VDDCA VDDQ	50	50		
	1/2 Array	IDD6 <sub>1</sub>	VDD1	1700	2200		μA
		IDD6 <sub>2</sub>	VDD2	6700	9000		
		IDD6 <sub>IN</sub>	VDDCA VDDQ	50	50		
	1/4 Array	IDD6 <sub>1</sub>	VDD1	1500	2000		μA
		IDD6 <sub>2</sub>	VDD2	6000	8000

	1/8 Array	IDD6 <sub>1</sub>	VDD1	1300	1600		μA
		IDD6 <sub>2</sub>	VDD2	5400	7200		
		IDD6 <sub>IN</sub>	VDDCA VDDQ	50	50		

**Note 1:** IDD6 currents are measured using bank-masking only.

**Note 2:** IDD values published are the maximum of the distribution of the arithmetic mean.

### Single-Ended AC and DC Output Levels

Symbol	Parameter	Value	Units	
$V_{OH(AC)}$	AC output HIGH measurement level	$V_{REF} + 0.12$	V	
$V_{OL(AC)}$	AC output LOW measurement level	$V_{REF} - 0.12$	V	
$V_{OH(DC)}$	DC output HIGH measurement level	$0.9 \times V_{DDQ}$	V	
$V_{OL(DC)}$	DC output LOW measurement level	$0.1 \times V_{DDQ}$	V	
$V_{OL(DC)ODT,enabled}$	DC output LOW measurement level (for I-V curve linearity);ODT enabled DQS_t	$V_{DDQ} \times \{0.1 + 0.9 \times [RON / (RTT + RON)]\}$	V	
$I_{OZ}$	Output leakage current (DQ, DM, DQS) (DQ, DQS are disabled; $0V \leq V_{OUT} \leq V_{DDQ}$ )	Min	-5	uA
		Max	5	uA

**Note 1:**  $I_{OH} = -0.1mA$ .

**Note 2:**  $I_{OL} = 0.1mA$ .

**Note 3:** The minimum value is derived when using  $RTT_{min}$  and  $RON_{max}$  ( $\pm 30\%$  uncalibrated,  $\pm 15\%$  calibrated).

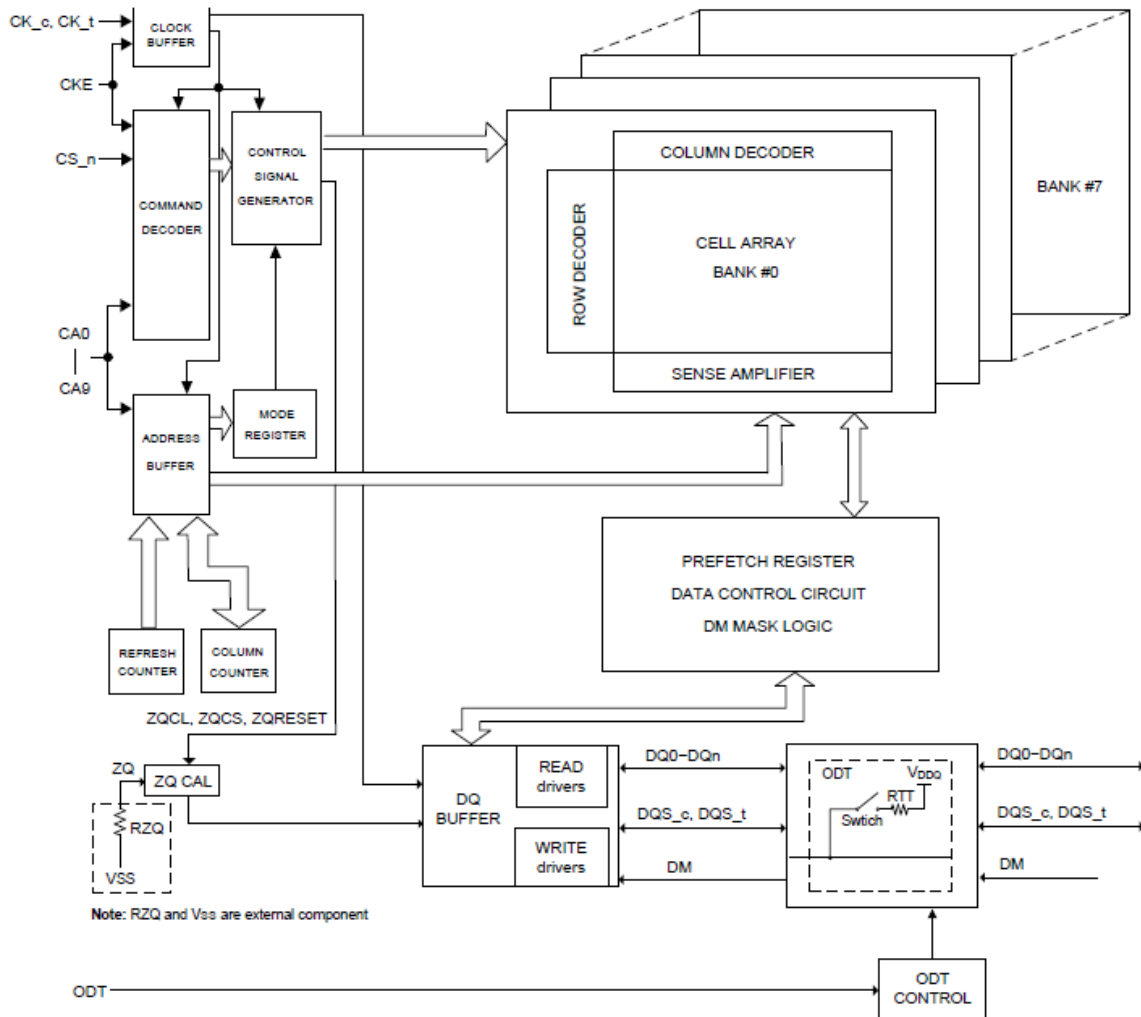

### Differential AC and DC Output Levels

Symbol	Parameter	LPDDR2 200-1066	Units
$V_{OHdiff(AC)}$	AC differential output HIGH measurement level	$+ 0.20 \times V_{DDQ}$	V
$V_{OLdiff(AC)}$	AC differential output LOW measurement level	$- 0.20 \times V_{DDQ}$	V

**Note 1:**  $I_{OH} = -0.1mA$ .

**Note 2:**  $I_{OL} = 0.1mA$ .

RAS-to-CAS delay (derated)	trCD	MIN	trCD + 1.875		nS
Activate -to- Activate command period (derated)	trC	MIN	trC + 1.875		nS
Row active time (derated)	trAS	MIN	trAS + 1.875		nS
Row precharge time (derated)	trP	MIN	trP + 1.875		nS
Active bank A to active bank B (derated)	trRD	MIN	trRD + 1.875		nS

**Note 1:** Frequency values are for reference only. Clock cycle time (Tck) is used to determine device capabilities.

**Note 2:** All AC timings assume an input slew rate of 2 V/ns.

**Note 3:** Measured with 4 V/ns differential CK\_t/CK\_c slew rate and nominal VIX

**Note 4:** READ, WRITE, and input setup and hold values are referenced to VREF.

**Note 5:** tDQCKDS is the absolute value of the difference between any two tDQCK measurements (in a byte lane) within a contiguous sequence of bursts in a 160ns rolling window. tDQCKDS is not tested and is guaranteed by design. Temperature drift in the system is <math><10^{\circ}\text{C/s}</math>. Values do not include clock jitter.

**Note 6:** tDQCKDM is the absolute value of the difference between any two tDQCK measurements (in a byte lane) within a 1.6  $\mu\text{s}$  rolling window. tDQCKDM is not tested and is guaranteed by design. Temperature drift in the system is <math><10^{\circ}\text{C/s}</math>. Values do not include clock jitter.

**Note 7:** tDQCKDL is the absolute value of the difference between any two tDQCK measurements (in a byte lane) within a 32ms rolling window. tDQCKDL is not tested and is guaranteed by design. Temperature drift in the system is <math><10^{\circ}\text{C/s}</math>. Values do not include clock jitter.

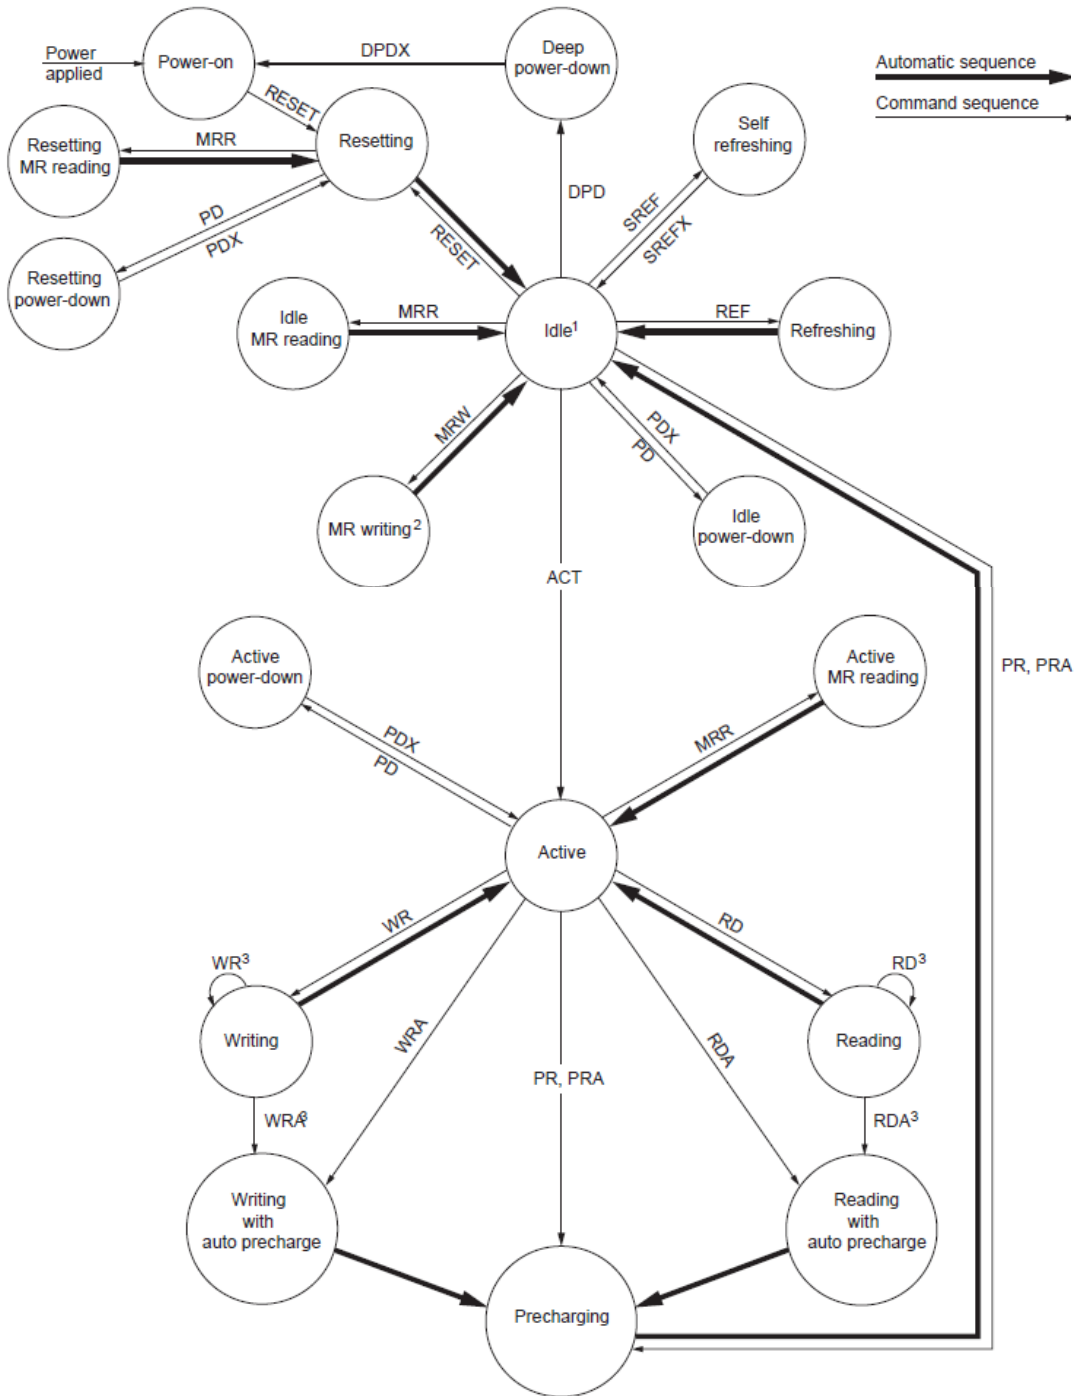

**Note 8:** For LOW-to-HIGH and HIGH-to-LOW transitions, the timing reference is at the point when the signal crosses the transition threshold (VTT). tHZ and tLZ transitions occur in the same access time (with respect to clock) as valid data transitions. These parameters are not referenced to a specific voltage level but to the time when the device output is no longer driving (for tRPST, tHZ(DQS) and tHZ(DQ)), or begins driving (for tRPRE, tLZ(DQS) and tLZ(DQ)). The figure below shows a method to calculate the point when the device is no longer driving tHZ(DQS) and tHZ(DQ) or begins driving tLZ(DQS) and tLZ(DQ) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent. The parameters tLZ(DQS), tLZ(DQ), tHZ(DQS), and tHZ(DQ) are defined as single-ended. The timing parameters tRPRE and tRPST are determined from the differential signal DQS.

Output Transition Timing

- Note 9:** Measured from the point when DQS begins driving the signal, to the point when DQS begins driving the first rising strobe edge.
- Note 10:** Measured from the last falling strobe edge of DQS to the point when DQS finishes driving the signal.
- Note 11:** CKE input setup time is measured from CKE reaching a HIGH/LOW voltage level to CK crossing.
- Note 12:** CKE input hold time is measured from CK crossing to CKE reaching a HIGH/LOW voltage level.
- Note 13:** Input setup/hold time for signal (CA[9:0], /CS).
- Note 14:** To ensure device operation before the device is configured, a number of AC boot timing parameters are defined in this table. Boot parameter symbols have the letter b appended (for example, tCK during boot is tCKb).
- Note 15:** Mobile LPDDR3 devices set some mode register default values upon receiving a RESET (MRW) command, as specified in Mode Register Definition.
- Note 16:** The output skew parameters are measured with default output impedance settings using the reference load.
- Note 17:** The minimum tCK column applies only when tCK is greater than 6ns.

- Note 1:** All commands are defined by states of CS\_n, CA0, CA1, CA2, CA3, and CKE at the rising edge of the clock.
- Note 2:** Bank addresses BA0, BA1, BA2 (BA) determine which bank is to be operated upon.
- Note 3:** AP “high” during a Read or Write command indicates that an auto-precharge will occur to the bank associated with the Read or Write command.
- Note 4:** “X” means “H or L (but a defined logic level)”, except when the LPDDR3 SDRAM is in PD, SREF, or DPD, in which case CS\_n, CK\_t/CK\_c, and CA can be floated after the required tCPDED time is satisfied, and until the required exit procedure is initiated as described in the respective entry/exit procedure.
- Note 5:** Self refresh exit and Deep Power Down exit are asynchronous.
- Note 6:** VREF must be between 0 and VDDQ during Self Refresh and Deep Down operation.
- Note 7:** CAx<sub>r</sub> refers to command/address bit “x” on the rising edge of clock.
- Note 8:** CAx<sub>f</sub> refers to command/address bit “x” on the falling edge of clock.

**Note 9:** CS<sub>n</sub> and CKE are sampled at the rising edge of clock.

**Note 10:** The least significant column address C0 is not transmitted on the CA bus, and is inferred to be zero.

**Note 11:** AB HIGH during a PRECHARGE command indicates that an all-bank precharge will occur. In this case, bank address is a "Don't Care."

**Note 12:** When CS<sub>n</sub> is HIGH, LPDDR3 CA bus can be floated.

## CKE Truth Table

Item	Command(n)	Operation	/CS	CKE		Notes
				n-1	n	
Active Power Down	X	Maintain Active Power Down	X	L	L	
	NOP	Exit Active Power Down	H	L	H	6,7
Idle Power Down	X	Maintain Idle Power Down	X	L	L	
	NOP	Exit Idle Power Down	H	L	H	6,7
Resetting Power Down	X	Maintain Resetting Power Down	X	L	L	
	NOP	Exit Resetting Power Down	H	L	H	6,7,8
Deep Power Down	X	Maintain Deep Power Down	X	L	L	
	NOP	Exit Deep Power Down	H	L	H	9
Self Refresh	X	Maintain Self Refresh	X	L	L	
	NOP	Exit Self Refresh	H	L	H	10,11
Bank(s) Active	NOP	Enter Active Power Down	H	H	L	
All Banks Idle	NOP	Enter Idle Power Down	H	H	L	12
	Enter Self-Refresh	Enter Self Refresh	L	H	L	12
	DPD	Enter Deep Power Down	L	H	L	12
Resetting	NOP	Enter Resetting Power Down	H	H	L	
Other states	Refer to the Command Truth Table			H	H	

**Note 1:** All states and sequences not shown are illegal or reserved unless explicitly described elsewhere in this document.

**Note 2:** 'X' means 'Don't care'.

**Note 3:** "Current state" is the state of the LPDDR3 device immediately prior to clock edge n.

**Note 4:** "CKEn" is the logic state of CKE at clock rising edge n; "CKEn-1" was the state of CKE at the previous clock edge.

**Note 5:** "CS<sub>n</sub>" is the logic state of CS<sub>n</sub> at the clock rising edge n;

**Note 6:** "Command n" is the command registered at clock edge N, and "Operation n" is a result of "Command n".

**Note 7:** Power Down exit time (t<sub>XP</sub>) should elapse before a command other than NOP is issued. The clock must toggle at least twice during the t<sub>XP</sub> period.

**Note 8:** Self-Refresh exit time (t<sub>XS</sub>) should elapse before a command other than NOP is issued. The clock must toggle at least twice during the t<sub>XS</sub> time.

**Note 9:** The Deep Power-Down exit procedure must be followed as discussed in the Deep Power-Down section of the Functional Description.

**Note 10:** Upon exiting Resetting Power Down, the device will return to the idle state if t<sub>INIT5</sub> has expired.

**Note 11:** In the case of ODT disabled, all DQ output shall be Hi-Z. In the case of ODT enabled, all DQ shall be terminated to VDDQ.

**Current State Bank n – Command to Bank n**

Current State	Command	Operation	Next State	Notes
Any	NOP	Continue previous operation	Current State	
Idle	ACTIVATE	Select and activate row	Active	
	Refresh (Per Bank)	Begin to refresh	Refreshing (Per Bank)	6
	Refresh (All Bank)	Begin to refresh	Refreshing (AllBank)	7
	MRW	Load value from Mode Register	MR Writing	7
	MRR	Read value from Mode Register	Idle / MR Reading	
	Reset	Begin Device Auto-initialization	Resetting	7,8
Row Active	Precharge	Deactivate row in bank or banks	Precharging	9,10
	Read	Select column, Read and start read burst	Reading	
	Write	Select column, and start write burst	Writing	
	MRR	Read value from Mode Register	Active MR Reading	
Reading	Precharge	Deactivate row in bank or banks	Precharging	9
	Read	Select column, and start new read burst	Reading	11,12
Writing	Write	Select column, and start write burst	Writing	11,12, 13
	Read	Select column, and start new read burst	Reading	11,12, 14
Power On	MRW Reset	Begin Device Auto-initialization	Resetting	7,9
Resetting	MRR	Read value from Mode Register	Resetting MR Reading	

**Note 1:** Values in this table apply when both CKEn -1 and CKEn are HIGH, and after tXSR or tXP has been met, if the previous state was power-down.

**Note 2:** All states and sequences not shown are illegal or reserved.

**Note 3:** Current state definitions:

State	Definition
Idle	The bank or banks have been precharged, and tRP has been met.
Active	A row in the bank has been activated, and tRCD has been met. No data bursts or accesses, and no register accesses, are in progress.
Reading	A READ burst has been initiated with auto precharge disabled, and has not yet terminated.
Writing	A WRITE burst has been initiated with auto precharge disabled, and has not yet terminated.

**Note 4:** The states listed below must not be interrupted by a command issued to the same bank. NOP commands or supported commands to the other bank should be issued on any clock edge occurring during these states. Supported commands to the other banks are determined by that bank's current state, and the definitions given in the table: Current State Bank n to Command to Bank m..

State	Starts With...	Ends When..	Notes
Precharging	Registration of a PRECHARGE command	tRP is met	After tRP is met, the bank is in the idle state.

State	Starts With...	Ends When..	Notes
Row activating	Registration of an ACTIVATE command	tRCD is met	After tRCD is met, the bank is in the active state.
READ with AP enabled	Registration of a READ command with auto precharge enabled	tRP is met	After tRP is met, the bank is in the idle state.
WRITE with AP enabled	Registration of a WRITE command with auto precharge enabled	tRP is met	After tRP is met, the bank is in the idle state.

**Note 5:** The states listed below must not be interrupted by any executable command. NOP commands must be applied to each positive clock edge during these states.

State	Starts With...	Ends When..	Notes
Refreshing (per bank)	Registration of a REFRESH (per bank) command	tRFCpb is met	After tRFCpb is met, the bank is in the idle state.
Refreshing (all banks)	Registration of a REFRESH (all banks) command	tRFCab is met	After tRFCab is met, the device is in the all banks idle state.
Idle MR reading	Registration of the MRR command	tMRR is met	After tMRR is met, the device is in the all banks idle state.
Resetting MR reading	Registration of the MRR command	tMRR is met	After tMRR is met, the device is in the all banks idle state.
Active MR reading	Registration of the MRR command	tMRR is met	After tMRR is met, the bank is in the active state.
MR writing	Registration of the MRW command	tMRW is met	After tMRW is met, the device is in the all banks idle state.
Precharging all	Registration of a PRECHARGE ALL command	tRP is met	After tRP is met, the device is in the all banks idle state.

**Note 6:** Bank-specific; requires that the bank is idle and no bursts are in progress.

**Note 7:** Not bank-specific; requires that all banks are idle and no bursts are in progress.

**Note 8:** Not bank-specific. reset command is achieved through Mode Register Write command.

**Note 9:** This command may or may not be bank-specific. If all banks are being precharged, they must be in a valid state for precharging.

**Note 10:** If a PRECHARGE command is issued to a bank in the idle state, tRP still applies.

**Note 11:** A command other than NOP should not be issued to the same bank while a READ or WRITE with auto precharge is enabled.

**Note 12:** The new READ or WRITE command could be auto precharge enabled or auto precharge disabled.

**Note 13:** A WRITE command can be issued only after the completion of the READ burst.

**Note 14:** A READ command can be issued only after completion of the WRITE burst.

**Current State Bank n – Command to Bank m**

Current State	Command	Operation	Next State	Notes
Any	NOP	Continue previous operation	Current State	
Idle	Any	Any command allowed to Bank m	-	
Row Activating, Active, or Precharging	Activate	Select and activate row in Bank m	Active	6
	Read	Select column, and start read burst from Bank m	Reading	7
	Write	Select column, and start write burst to Bank m	Writing	7
	Precharge	Deactivate row in bank or banks	Precharging	8
	MRR	Read value from Mode Register	Idle MR Reading or Active MR Reading	9,10, 11
Reading (AP disabled)	Read	Select column, and start read burst from Bank m	Reading	7
	Write	Select column, and start write burst to Bank m	Writing	7,12
	Activate	Select and activate row in Bank m	Active	
	Precharge	Deactivate row in bank or banks	Precharging	8
Writing (AP disabled)	Read	Select column, and start read burst from Bank m	Reading	7,13
	Write	Select column, and start write burst to Bank m	Writing	7
	Activate	Select and activate row in Bank m	Active	
	Precharge	Deactivate row in bank or banks	Precharging	8
Reading with Auto-Precharge	Read	Select column, and start read burst from Bank m	Reading	7,14
	Write	Select column, and start write burst to Bank m	Writing	7,12, 14
	Activate	Select and activate row in Bank m	Active	
	Precharge	Deactivate row in bank or banks	Precharging	8
Writing with Auto-Precharge	Read	Select column, and start read burst from Bank m	Reading	7,13, 14
	Write	Select column, and start write burst to Bank m	Writing	7,14
	Activate	Select and activate row in Bank m	Active	
	Precharge	Deactivate row in bank or banks	Precharging	8
Power On	Reset	Begin Device Auto-initialization	Resetting	15,16
Resetting	MRR	Read value from Mode Register	Resetting MR Reading	

**Note 1:** This table applies when:

- The previous state was self refresh or power-down;
- After tXSR or tXP has been met; and when both CKEn -1 and CKEn are HIGH.

**Note 2:** All states and sequences not shown are illegal or reserved..

**Note 3:** Current state definitions:.

State	Condition	And...	And...
Idle	The bank has been precharged	tRP is met	
Active	A row in the bank has been activated	tRCD is met	No data bursts/accesses and no register accesses are in progress.
Reading	A READ burst has been initiated with auto precharge disabled	The READ has not yet terminated	
Writing	A WRITE burst has been initiated with auto precharge disabled	The WRITE has not yet terminated	

**Note 4:** Refresh, self refresh, and MRW commands can only be issued when all banks are idle.

**Note 5:** The states listed below must not be interrupted by any executable command. NOP commands must be applied during each clock cycle while in these states:

State	Starts With...	Ends When..	Notes
Idle MR reading	Registration of the MRR command	tMRR is met	After tMRR is met, the device is in the all banks idle state.
Resetting MR reading	Registration of the MRR command	tMRR is met	After tMRR is met, the device is in the all banks reset state.
Active MR reading	Registration of the MRR command	tMRR is met	After tMRR is met, the bank is in the active state.
MR writing	Registration of the MRW command	tMRW is met	After tMRW is met, the device is in the all banks idle state.

**Note 6:** tRRD must be met between the ACTIVATE command to bank n and any subsequent ACTIVATE command to bank m.

**Note 7:** READs or WRITEs listed in the command column include READs and WRITEs with or without auto precharge enabled.

**Note 8:** This command may or may not be bank-specific. If all banks are being precharged, they must be in a valid state for precharging.

**Note 9:** MRR is supported in the row-activating state.

**Note 10:** MRR is supported in the precharging state.

**Note 11:** The next state for bank m depends on the current state of bank m (idle, row-activating, precharging, or active).

**Note 12:** A WRITE command can be issued only after the completion of the READ burst.

**Note 13:** A READ command can be issued only after the completion of the WRITE burst.

**Note 14:** A READ with auto precharge enabled or a WRITE with auto precharge enabled can be followed by any valid command to other banks, provided that the timing restrictions in the PRECHARGE and Auto Precharge Clarification table are met.

**Note 15:** Not bank-specific; requires that all banks are idle and no bursts are in progress.

**Note 16:** RESET command is achieved through the MODE REGISTER WRITE command.

## IDD Measurement Conditions

Falling	H	H	N+3	NOP	HLH	HLHLLHL	L
Rising	H	L	N+4	Read_Rising	HLH	HLHLLHL	H
Falling	H	L	N+4	Read_Falling	LHH	HHHHHHH	H
Rising	H	H	N+5	NOP	HHH	HHHHHHH	H
Falling	H	H	N+5	NOP	HHH	HHHHHHH	L
Rising	H	H	N+6	NOP	HHH	HHHHHHH	L
Falling	H	H	N+6	NOP	HHH	HHHHHHH	L
Rising	H	H	N+7	NOP	HHH	HHHHHHH	H
Falling	H	H	N+7	NOP	HLH	LHLHLHL	L

**Notes 1:** Data strobe (DQS<sub>t</sub>) is changing between HIGH and LOW with every clock cycle.

**Notes 2:** The noted pattern (N, N + 1...) is used continuously during IDD measurement for IDD4R.

## Switching for IDD4W

Clock	CKE	CS <sub>n</sub>	Clock Cycle Number	Command	CA[2:0]	CA[9:3]	All DQ
Rising	H	L	N	Write_Rising	HLL	LHLHLHL	L
Falling	H	L	N	Write_Falling	LLL	LLLLLLL	L
Rising	H	H	N+1	NOP	LLL	LLLLLLL	H
Falling	H	H	N+1	NOP	LLL	LLLLLLL	L
Rising	H	H	N+2	NOP	LLL	LLLLLLL	H
Falling	H	H	N+2	NOP	LLL	LLLLLLL	H
Rising	H	H	N+3	NOP	LLL	LLLLLLL	H
Falling	H	H	N+3	NOP	HLL	HLHLLHL	L
Rising	H	L	N+4	Write_Rising	HLL	HLHLLHL	H
Falling	H	L	N+4	Write_Falling	LHH	HHHHHHH	H
Rising	H	H	N+5	NOP	HHH	HHHHHHH	H
Falling	H	H	N+5	NOP	HHH	HHHHHHH	L
Rising	H	H	N+6	NOP	HHH	HHHHHHH	L
Falling	H	H	N+6	NOP	HHH	HHHHHHH	L
Rising	H	H	N+7	NOP	HHH	HHHHHHH	H
Falling	H	H	N+7	NOP	HLL	LHLHLHL	L

**Notes 1:** Data strobe (DQS<sub>t</sub>) is changing between HIGH and LOW with every clock cycle.

**Notes 2:** Data masking (DM) must always be driven LOW.

**Notes 3:** The noted pattern (N, N + 1...) is used continuously during IDD measurement for IDD4W

## Burst Sequence

Burst Length	C2	C1	C0	Burst Cycle Number and Burst Address Sequence							
				1	2	3	4	5	6	7	8
8	0b	0b	0b	0	1	2	3	4	5	6	7
	0b	1b	0b	2	3	4	5	6	7	0	1
	1b	0b	0b	4	5	6	7	0	1	2	3
	1b	1b	0b	6	7	0	1	2	3	4	5

**Notes 1:** C0 input is not present on CA bus. It is implied zero.

**Notes 2:** The burst address represents C2 – C0.

## Power-up, Initialization, and Power-Off

### Voltage Ramp and Device Initialization

The following sequence must be used to power up the device. Unless specified otherwise, this procedure are mandatory.

#### Power Ramp

While applying power (after  $T_a$ ), CKE must be held LOW ( $\leq 0.2 \times VDDCA$ ) and all other inputs must be between  $V_{ILmin}$  and  $V_{IHmax}$ . The device outputs remain at High-Z while CKE is held LOW.

Following the completion of the voltage ramp ( $T_b$ ), CKE must be maintained LOW. DQ, DM, DQS<sub>t</sub> and DQS<sub>c</sub> voltage levels must be between VSS and VDDQ during voltage ramp to avoid latch-up. CK<sub>t</sub>, CK<sub>c</sub>, CS<sub>n</sub>, and CA input levels must be between VSS and VDDCA during voltage ramp to avoid latch-up. Voltage ramp power supply requirements are provided in Table below..

After	Applicable Conditions
Ta is reached	VDD1 must be greater than VDD2 - 200mV
	VDD1 and VDD2 must be greater than VDDCA - 200mV
	VDD1 and VDD2 must be greater than VDDQ - 200mV
	VREF must always be less than all other supply voltages

**Notes 1:**  $T_a$  is the point when any power supply first reaches 300mV.

**Notes 2:** Noted conditions apply between  $T_a$  and power-down (controlled or uncontrolled).

**Notes 3:**  $T_b$  is the point at which all supply and reference voltages are within their defined operating ranges.

**Notes 4:** Power ramp duration  $t_{INIT0}$  ( $T_b - T_a$ ) must not exceed 20 mS.

**Notes 5:** The voltage difference between of VSS pin must not exceed 100 mV.

Beginning at  $T_b$ , CKE must remain LOW for at least  $t_{INIT1}$ , after which CKE can be asserted HIGH. The clock must be stable at least  $t_{INIT2}$  prior to the first CKE LOW-to-HIGH transition ( $T_c$ ). CKE, CS<sub>n</sub>, and CA inputs must observe setup and hold requirements ( $t_{IS}$ ,  $t_{IH}$ ) with respect to the first rising clock edge (as well as to subsequent falling and rising edges).

If any MRR commands are issued, the clock period must be within the range defined for  $t_{CKb}$ . MRW commands can be issued at normal clock frequencies as long as all AC timings are met. Some AC parameters (for example,  $t_{DQSCK}$ ) could have relaxed timings (such as  $t_{DQSCKb}$ ) before the system is appropriately configured. While keeping CKE HIGH, NOP commands must be issued for at least  $t_{INIT3}$  ( $T_d$ ). The ODT input signal may be in undefined state until  $t_{IS}$  before CKE is registered HIGH. When CKE is registered HIGH, the ODT input signal shall be statically held at either LOW or HIGH. The ODT input signal remains static until the power up initialization sequence is finished, including the expiration of  $t_{ZQINIT}$ .

#### Reset command

After  $t_{INIT3}$  is satisfied, a MRW(Reset) command must be issued ( $T_d$ ). An optional PRECHARGE ALL command can be issued prior to the MRW RESET command. Wait at least  $t_{INIT4}$  while keeping CKE asserted and issuing NOP commands. Only NOP commands are allowed during  $t_{INIT4}$ .

### ***Mode Registers Reads and Device Auto-Initialization (DAI) polling***

After  $t_{INIT4}$  is satisfied ( $T_e$ ), only MRR commands and POWER-DOWN ENTRY/EXIT commands are supported, and CKE can go LOW in alignment with power-down entry and exit specifications (see Power-Down). MRR commands are valid at this time only when the CA bus does not need to be trained. CA training can begin only after time  $T_f$ . The MRR command can be initiated to poll the DAI bit, which indicates whether device auto initialization is complete. When the bit indicates completion, the device is in an idle state. The device is also in an idle state after  $t_{INIT5}$  (MAX) has expired, regardless whether the DAI bit has been read by the MRR command. Because the memory output buffers are not properly configured by  $T_e$ , some AC parameters must use relaxed timing specifications before the system is appropriately configured. After the DAI bit (MR0, DAI) is set to zero by the memory device (DAI complete), the device is in the idle state ( $T_f$ ). DAI status can be determined by issuing the MRR command to MR0. The device sets the DAI bit no later than  $t_{INIT5}$  after the RESET command. The controller must wait at least  $t_{INIT5}$  (MAX) or until the DAI bit is set before proceeding.

### ***ZQ Calibration***

If CA training is not required, the MRW INITIALIZATION CALIBRATION (ZQ\_CAL) command can be issued to the memory (MR10) after  $T_f$ . No other CA commands (other than RESET or NOP) may be issued prior to the completion of CA training. After the completion of CA training ( $T_f'$ ), the MRW INITIALIZATION CALIBRATION (ZQ\_CAL) command can be issued to the memory. This command is used to calibrate output impedance over process, voltage, and temperature. In systems where more than one LPDDR3 device exists on the same bus, the controller must not overlap MRW ZQ\_CAL commands. The device is ready for normal operation after  $t_{ZQINIT}$ .

### ***Normal Operation***

After  $t_{ZQINIT}$  ( $T_g$ ), MRW commands must be used to properly configure the memory (for example, output buffer drive strength, latencies, and so on). Specifically, MR1, MR2, and MR3 must be set to configure the memory for the target frequency and memory configuration. After the initialization sequence is complete, the device is ready for any valid command. After  $T_g$ , the clock frequency can be changed using the procedure described in the Input Clock Frequency Changes and Clock Stop Events section.

### ***Mode Register Definition***

For LPDDR3, a set of mode registers is used for programming device operating parameters, reading device information and status, and for initiating special operations such as DQ calibration, ZQ calibration, and device reset.

### ***Mode Register Assignment and Definition***

The table listed below shows the mode registers for LPDDR3 SDRAM. Each register is denoted as “R” if it can be read but not written, “W” if it can be written but not read, and “R/W” if it can be read and written. A Mode Register Read command is used to read a mode register. A Mode Register Write command is used to write a mode register.

**Mode Register Assignments**

MR#	MA[7:0]	Function	Access	OP7	OP6	OP5	OP4	OP3	OP2	OP1	OP0
0	00H	Device Info.	R	RL3	WL (Set B)	(RFU)	RZQI	(RFU)	(RFU)	DAI

63	3FH	Reset	W	X							
64:255	40H~FFH	(Reserved)	-	(RFU)							

**Notes 1:** RFU bits must be set to “0” during Mode Register writes.

**Notes 2:** RFU bits must be read as “0” during Mode Register reads.

**Notes 3:** All mode registers that are specified as RFU or write-only shall return undefined data when read and DQS\_t, DQS\_c shall be toggled.

**Notes 4:** All mode registers that are specified as RFU shall not be written.

**Notes 5:** Writes to read-only registers shall have no impact on the functionality of the device.

**MR0\_Device Information (MA[7:0] = 00H)**

OP7	OP6	OP5	OP4	OP3	OP2	OP1	OP0
RL3	WL (Set B) Support	(RFU)	RZQI		(RFU)		DAI

DAI (Device Auto-Initialization Status)	Read-only	OP0	<b>0<sub>b</sub></b> : DAI complete <b>1<sub>b</sub></b> : DAI still in progress	
RZQI (Built in Self Test for RZQ Information)	Read-only	OP[4:3]	<b>00<sub>b</sub></b> : RZQ self test not executed. <b>01<sub>b</sub></b> : ZQ-pin may connect to VDDCA or float <b>10<sub>b</sub></b> : ZQ-pin may short to GND <b>11<sub>b</sub></b> : ZQ-pin self test completed, no error condition detected (ZQ-pin may not connect to VDDCA or float nor short to GND)	1-4
WL (Set B) Support	Read-only	OP[6]	<b>0<sub>b</sub></b> : DRAM does not support WL (Set B)	
RL3 Option Support	Read-only	OP[7]	<b>0<sub>b</sub></b> : DRAM does not support RL=3, nWR=3, WL=1	

**Notes 1:** RZQI will be set upon completion of the MRW ZQ Initialization Calibration command.

**Notes 2:** If ZQ is connected to VDDCA to set default calibration, OP[4:3] shall be set to 01. If ZQ is not connected to VDDCA, either OP[4:3]=01 or OP[4:3]=10 might indicate a ZQ-pin assembly error. It is recommended that the assembly error is corrected.

**Notes 3:** In the case of possible assembly error (either OP[4:3]=01 or OP[4:3]=10 per Note 4), the LPDDR3 device will default to factory trim settings for RON, and will ignore ZQ calibration commands. In either case, the system may not function as intended.

**Notes 4:** In the case of the ZQ self-test returning a value of 11b, this result indicates that the device has detected a resistor connection to the ZQ pin. However, this result cannot be used to validate the ZQ resistor value or that the ZQ resistor tolerance meets the specified limits (i.e. 240Ω ±1%).

**MR1\_Device Feature 1 (MA[7:0] = 01H)**

OP7	OP6	OP5	OP4	OP3	OP2	OP1	OP0
nWR (for AP)			(RFU)		BL
